INDUSTRIAL

Enabling Value Added—Across Western Canada, lumber yards are evolving from simple storage sites into value-added processing hubs. Driven by demand for faster multi-family construction, labour shortages, and tighter schedules, the industry is shifting toward pre-cut, engineered wood framing packages produced in controlled environments. Early adopters like Country Lumber are on the vanguard of this shift, investing in new technology,

products, and services to better support the building industry. By integrating advanced cutting lines within enclosed MegaDome structures, they are improving precision, reducing waste, and enabling consistent, year-round production, and enables Country Lumber to deliver ready-to-install framing components, moving upstream in the construction value chain.
