Turning Waste Into Opportunity— Pacific Coast Renewables is helping build a cleaner future by transforming organic waste into valuable resources at its Abbotsford facility. As operations continue to grow and evolve, the company required a large, efficient space to support its compost screening and material-handling operations. The new XP100 MegaDome® provides

the expansive, column-free working area needed for equipment, material movement and year-round operations. With its naturally bright interior and durable fabric-covered design, the structure provides a practical addition to Pacific Coast Renewables' expanding facility—supporting their continued commitment to turning waste into resources and moving communities closer to a zero-waste future.
